MOCH. LUTHFI HADIWIDJAJA

Frontend Engineer - Trading UI, Data Visualisation & Interface Design

Purwakarta, West Java, Indonesia | luthfihadi78@gmail.com | linkedin.com/in/moch-luthfi-hadiwidjaja-aa91b5171 | github.com/luthfihadi78 | luthfihadi78.github.io/portofolio

SUMMARY

Front-end engineer and interface designer for data-dense trading products. I designed and hand-built the entire Qkuk Terminal web application - HTML, CSS, JavaScript, canvas and SVG, with no framework, no chart library and no build step: a physics bubble map, a composite direction gauge, equity and win-rate charts, signal tables, and a token-based dark UI that stays readable on a phone. I also design and ship mobile interfaces (Flutter) and my own portfolio site. Seven years in Web3 means the vocabulary a trading screen needs - funding, open interest, liquidations, order types, confirmations - is native to me, so I design the screen a trader actually reads instead of a generic chart page. My production front end so far is hand-written JavaScript rather than React or Next.js, and I would rather say that plainly than have it discovered in a technical interview.

CORE SKILLS

- **Front end:** HTML5, CSS3 (grid, flex, custom properties, responsive, prefers-reduced-motion), JavaScript (ES6), Canvas 2D, SVG, service worker, CSP-safe architecture, accessible markup and keyboard states
- **Interface design:** layout and typography systems, dark UI and colour tokens, data visualisation, dashboard information hierarchy, empty / loading / degraded / error states, iterating a design from user complaints rather than taste
- **Mobile UI:** Flutter and Dart, Jetpack Compose, Material Design, custom camera surface, offline-first screens
- **Domain:** crypto trading interfaces - order book, funding, open interest, liquidation levels, signal lifecycle, wallet and bridge flows
- **Supporting engineering:** Node.js, REST APIs, JSON/CSV state pipelines, Java and Oracle, PostgreSQL, Git, Linux, Docker
- **Quality:** cross-device and cross-browser checks, defect reproduction, performance budgets for long-running dashboards

PROFESSIONAL EXPERIENCE

Software Engineer / QA Engineer - December 2024 - Present

PT. LG Sinarmas Technology Solutions | *Contract* | *Indonesia*

Delivery consultant across three client engagements, moving between development and quality assurance as each project required.

Enterprise platform work

- Build and test service-layer components in Java against an Oracle database for a bank finance system (Deposit module), and validate behaviour at the database level rather than trusting what the screen reports.
- Partner-side QA on the CleverTap customer engagement platform, covering functional behaviour across the product; two vendor certifications (Platform Core, Platform Advanced).
- Current engagement: warehouse and goods-shipping systems at LG Electronics - tracing records end to end when a number on screen does not match the data behind it.

Web3 Testnet Contributor - June 2019 - June 2024

Freelance | *Remote*

- Worked through hundreds of pre-release dApp interfaces across 500+ projects - wallets, bridges, explorers, faucets - and reported failures with the steps needed to reproduce them.
- Built working familiarity with what a user actually sees when a transaction is pending, stuck, or reorganised - the states most interfaces handle badly.
- Observed a wide range of token designs, consensus mechanisms and failure modes, including many projects that never reached mainnet.

Research Assistant, Computer Vision Division - April 2016 - April 2018

LIPI Bandung, Indonesian Institute of Sciences | *Contract* | *Bandung*

WoodID

- Built the graphical interface for a wood-species identification tool so forestry staff could operate it without a developer present - the first interface I had to design for someone who was not me.
- Validated the system against thousands of specimens with the Ministry of Forestry; co-authored an ICOP Science paper (ICODIS 2018) and contributed to two registered Indonesian software copyrights.

SELECTED PROJECTS

Qkuk Terminal - web terminal for a live trading system | design and front end, 2025 - present

- Designed and built the entire interface myself: plain HTML, CSS and JavaScript, no framework, no chart library, no build step, served as three CSP-safe files.
- Bubble map: a physics canvas of floating coins with elastic collisions, press-and-hold dragging, search highlighting, tap-to-chart, and per-bubble state labels (picked by admin, side, waiting / in position / took profit). Size encodes the absolute 24h move so panic and euphoria read equally; colour encodes direction; an aura marks coins the engine has on record.
- Composite direction gauge with six named states and an explicit degraded state when an input is missing, so the UI never invents a reading. Equity and win-rate charts are hand-drawn SVG.
- Design decisions driven by use, not taste: the gauge was rebuilt after the first version was too twitchy to read; the bubble map was reworked until it answered 'where is the attention' at a glance; every figure is labelled backtest, live or simulation so two different truths never share one number.
- Responsive down to a phone, keyboard-accessible controls, reduced-motion support, a design-token palette, service worker for repeat visits, and a data-only publishing pipeline that cannot overwrite another contributor's files.

luthfihadi78.github.io and /portofolio - personal site and case study | 2026

- Designed and built both pages from scratch - typography, spacing scale, grid, responsive behaviour, illustration in SVG, scroll reveal and a printed-copy CV download - with no framework or CSS library.
- The portfolio is a long-form product case study: what each screen does, why it exists, and what was removed, rather than a gallery of screenshots.

SINERGI K3 - field inspection app | Flutter, Android | client work, PT. Toba Royal Indonesia

- Offline-first inspection workflow for certified safety inspectors: 141 Dart files, BLoC state management, and a screen flow that works with no network at all.
- Wrote a custom in-app camera preview because the system camera intent forces its own confirmation screen no third-party app can suppress - one shutter press now files the photo straight into the report.
- Official Microsoft Word reports generated on the device from nine Permenaker-aligned templates; encrypted local storage (AES key in the Android Keystore, bcrypt passwords).

QurbanId - Android capstone | Kotlin, Jetpack Compose, SQLite

- Capstone for the Dicoding Android Developer Bootcamp: built end to end in Kotlin with Compose, applying SOLID principles and Material components.

EDUCATION

Bachelor of Computational Science - Telkom University, Indonesia

CERTIFICATIONS

- CleverTap Platform Core Functionalities - partner certification
- CleverTap Platform Advanced Functionalities - partner certification
- Dicoding Academy Android Developer Bootcamp - capstone, Kotlin and Jetpack Compose

ADDITIONAL

Languages: Indonesian (native), English (professional working proficiency). Portfolio: luthfihadi78.github.io/portofolio · Live product: luthfihadi78.github.io/qkuk · Open to remote full-time or contract work.
