MOCH. LUTHFI HADIWIDJAJA

Frontend Engineer - Trading Interfaces, Realtime Data & Web3

Purwakarta, West Java, Indonesia | luthfihadi78@gmail.com | linkedin.com/in/moch-luthfi-hadiwidjaja-aa91b5171 | github.com/luthfihadi78 | luthfihadi78.github.io/portofolio

SUMMARY

Front-end engineer who builds trading interfaces end to end. For the past year I have been the only front-end engineer on Qkuk Terminal, a live crypto trading system: about 6,500 lines of hand-written JavaScript and 1,300 lines of CSS, no framework and no chart library, serving hundreds of live signals to real users. That work includes a canvas bubble map animating at 60fps with hit-testing and drag, hand-drawn SVG charts, sortable and filterable tables, a JSON state feed with stale and degraded states, a service worker and a strict-CSP build. I also wrote the Node side that publishes that state, so I know which parts of an API contract can mislead a UI. Before that: Java and Oracle finance backends, enterprise QA, and seven years in Web3 across 500+ testnets. My production React/Next.js experience is none yet - I say that plainly - and I am confident in the parts of this job that are harder than the framework: state, update paths, number handling and failure states.

CORE SKILLS

- **Front-end engineering:** JavaScript (ES6), DOM APIs, Canvas 2D, SVG, CSS custom properties, grid and flex, responsive layout, fetch and polling state, service worker, strict-CSP builds, hand-written components without a framework
- **Interface performance:** 60fps canvas animation loop, collision and hit-testing, press-and-hold drag on mouse and touch, incremental DOM updates keyed by signature instead of full re-renders, request throttling, cache-busting, stale-data handling
- **Data-heavy UI:** sortable and filterable tables over hundreds of rows, charts drawn from plain numbers, frozen levels that never move after publication, consistent number / percentage / R formatting, empty, loading, degraded and error states
- **Mobile front end:** Flutter and Dart, BLoC state management, Jetpack Compose, Material components, custom camera surface, offline-first screens
- **Back end and data:** Node.js, REST and JSON contracts, Java with Oracle, PostgreSQL, CSV/JSON state pipelines, scheduled publishing jobs
- **Web3 integration:** wallet and RPC flows, transaction lifecycle and confirmations, reorgs, bridges, block explorers, Solidity basics
- **Tooling and quality:** Git, Linux, Bash, Docker, cross-browser and cross-device checks, defect reproduction, performance budgets for long-running dashboards

PROFESSIONAL EXPERIENCE

Software Engineer / QA Engineer - December 2024 - Present

PT. LG Sinarmas Technology Solutions | *Contract* | *Indonesia*

Delivery consultant across three client engagements, moving between development and quality assurance as each project required.

Enterprise finance and platform work

- Build and test service-layer components in Java against an Oracle database for a bank finance system (Deposit module), and verify behaviour at the database level instead of trusting what the interface reports.
- Partner-side QA on the CleverTap customer engagement platform: functional and interface behaviour across the product, with two vendor certifications (Platform Core and Platform Advanced).
- Current engagement tests LG Electronics warehouse and shipping systems, tracing records end to end when a number on screen does not match the data behind it.

Web3 Testnet Contributor - June 2019 - June 2024

Freelance | *Remote*

- Worked through hundreds of pre-release dApp interfaces across 500+ projects - wallets, bridges, explorers, faucets - and reported failures with the steps needed to reproduce them, interface-level defects included.
- Built working familiarity with what the screen does while a transaction is pending, stuck or reorganised: the states most front ends handle worst.
- Observed a wide range of token designs, consensus mechanisms and failure modes, including many projects that never reached mainnet.

Research Assistant, Computer Vision Division - April 2016 - April 2018

LIPI Bandung, Indonesian Institute of Sciences | *Contract* | *Bandung*

WoodID

- Built the desktop interface for a wood-species identification tool so forestry staff could operate it without a developer present.

- Validated the system against thousands of specimens with the Ministry of Forestry; co-authored a paper through IOP Science (ICODIS 2018) and contributed to two registered Indonesian software copyrights.

SELECTED PROJECTS

Qkuk Terminal - front end of a live crypto trading system | 2025 - present | solo

- Own the entire front end: roughly 6,500 lines of JavaScript and 1,300 lines of CSS in three CSP-safe files, no framework, no chart library, no build step, served from a static host.
- Bubble map on a canvas: 60fps animation loop, elastic collisions, hit-testing, press-and-hold dragging on mouse and touch, live 24h numbers drawn per bubble, tap to open the chart, and incremental DOM updates keyed by state signature so a poll never rebuilds the page.
- Hand-drawn SVG charts (cumulative equity, win rate by hour, a six-state direction gauge) and sortable, filterable signal tables over hundreds of rows, with the levels frozen at publication.
- Live plumbing: one JSON state file polled on an interval with cache-busting, stale-data detection, an explicit degraded state when an input is missing, a service worker and reduced-motion support. The same code runs on a phone.
- Wrote the Node publishing side as well, so the front end and the state contract were designed together - including a writer that stages only its own files into a shared repository.
- TradingView Pine Script v6 indicator building the same primitives (market structure, order blocks, fair value gaps, liquidity sweeps) as an independent check on the engine.

luthfihadi78.github.io and /portofolio - static front end | 2026

- Two hand-written pages: layout, responsive behaviour, SVG illustration, scroll-driven reveal and a PDF download, with no framework, no CSS library and no build step.
- The portfolio is a long-form case study of the terminal's screens and the decisions behind them.

SINERGI K3 - field inspection app | Flutter, Android | client work, PT. Toba Royal Indonesia

- Offline-first inspection flow in Flutter and Dart (141 files, BLoC): the whole workflow runs with no network because inspectors work where there is none.
- Custom in-app camera preview, written because the system camera intent forces its own confirmation screen no third-party app can suppress.
- Official Word reports generated on the device from nine templates; encrypted local storage with an Android Keystore AES key and bcrypt password hashing.

QurbanId - Android capstone | Kotlin, Jetpack Compose, SQLite

- Capstone for the Dicoding Android Developer Bootcamp, built end to end with Compose and Material components.

EDUCATION

Bachelor of Computational Science - Telkom University, Indonesia

CERTIFICATIONS

- CleverTap Platform Core Functionalities - partner certification
- CleverTap Platform Advanced Functionalities - partner certification
- Dicoding Academy Android Developer Bootcamp - capstone, Kotlin and Jetpack Compose

ADDITIONAL

Languages: Indonesian (native), English (professional working proficiency). Portfolio: luthfihadi78.github.io/portofolio · Live product: luthfihadi78.github.io/qkuk · Open to remote full-time or contract work.
